

Mystics Civil

The Construction Operations Cockpit

From the first estimate to the final handover — one platform, one source of truth.

A pitch for forward-looking construction leaders

The Problem We Solve

Construction runs on coordination. Today it leaks through the cracks.

Where work breaks down	What it costs you
Daily progress lives in WhatsApp groups and paper registers	No live earned value; surprises at month-end
Bills, deductions and payments live in spreadsheets	TDS, retention, advances mis-applied; ledger never tied out
Approvals chase people over email and phone	Variations and bills sit for weeks; cash flow stalls
Quality and safety records are kept "for the file"	Audit failures; insurance claims rejected
Stores and procurement live in another system entirely	Stock-outs, double-ordering, vendor disputes

Mystics Civil replaces every one of those leaks with a single platform — built for the way Indian construction actually works.

One Platform. Every Role. Every Decision.

Secure, role-based access — every team member sees exactly what they need and nothing they don't. Built-in roles for Owner, PM, QS, Finance, Site Engineer, QC, Store, HR, Contractor — plus your own **custom roles** with hand-picked permissions.

Executive Dashboard — Your Morning Briefing

 Dashboard

Live KPIs from across every project: active vs total, pending approvals, DPRs filed today, budget vs actual, schedule variance. **One screen tells the leadership team what needs their attention.**

Projects — Plan, Run, Close

Every project carries a clear lifecycle: **Pending approval** → **Not started** → **On track / At risk / Delayed / On hold** → **Completed**. Each transition is logged and auditable. Quotas per organisation, automatic project-access grants, and one-click drill-down to any detail.

Project Cockpit — Everything in One Place

 Project Dashboard

A tabbed cockpit for every project: WBS, Milestones, Estimation, VOs, BOQ-vs-Actual, DPRs, Photos, Documents, Issues, Financial, Supply Chain, Workforce, Settings — all gated by the modules that organisation enables.

Site Location — Map-Aware Operations

 Site Location

Every project pinned on a real map. Powers the **attendance geofence** — workers can only be marked present from within 200 metres of the site. No more remote mark-ups, no more disputed muster.

Work Breakdown Structure — Live Earned Value

A hierarchical activity tree with planned and actual quantities. **Every approved Daily Progress Report updates the WBS automatically** — so earned value is always live, not a month-end report.

Milestones — What Matters, When

Critical-path milestones with health flags (on track, at risk, delayed, completed). Roll-up from the WBS gives leadership a one-glance answer to *"are we going to hit handover?"*

Estimation — From L0 to L5, with Live Rates

Five-level estimating ladder — order-of-magnitude through contract BOQ. Backed by a **rate library that refreshes itself nightly** from DSR, state schedules and your in-house catalogues. Bid with today's prices, not last quarter's.

DSR & Rate Engine — Pricing on Autopilot

Plug in DSR, state schedules, vendor quotes, your own catalogues. A scheduled job runs **every night at 2 AM** to refresh every enabled source. Manual sync available any time. Estimates are always priced on current data.

Variation Orders — Scope Change, Controlled

Variation Orders

Draft → Submitted → Approved (or Rejected). Once approved, VOs flow automatically into BOQ-vs-Actual, contractor billing and client invoicing. Locked terminal states give you a clean paper trail for the client and the auditor.

BOQ vs Actual — Money on the Floor

 BOQ vs Actual

Live variance by cost head, drillable to the activity that's bleeding. Combine approved VOs with executed quantities to spot cost creep before it becomes a write-off.

Daily Progress Reports — The Site's Heartbeat

Site engineer drafts the day's report — manpower, weather, quantities, photos. Submits it. PM approves from the inbox.
Approved quantities post to the WBS in the same transaction. No double entry. No reconciliation.

Photos & Documents — Site Evidence That Sticks

Geotagged site photos and versioned documents — drawings, contracts, certificates — stored securely and indexed by activity and date. Perfect for client updates, dispute resolution, and statutory audits.

Issues — A Snag List That Closes

Anyone on site raises an issue (low → critical). It stays open until resolved, with a clear trail of who fixed it and when. No more snag-list spreadsheets that nobody updates.

Finance — Bills, Deductions, Payments, Ledger

Contractor bills flow: **Draft → Verify → Certify → Approve → Pay**. On approval, the platform automatically applies **TDS, retention, labour welfare fund, and advance recovery**. GST registers. Ledger posts. Client invoicing mirrors the flow. **Zero manual journal entries**.

Supply Chain — From Indent to Stock

 Supply Chain

Indent → RFQ → Vendor responses → Award → PO → GRN (with QC) → Stock. Failed quality tests automatically open an NCR. Every stock movement is recorded in a permanent ledger. Rate contracts speed up repeat purchases.

Workforce & EHS — People, Payroll, Quality, Safety

Worker master with BOCW, bank details and trade. Geofenced bulk attendance. Payroll periods that **compute then lock**. ITPs, NCRs with CAPA tracking. HIRA, JSA, permits, PPE issues, incidents. Everything OSHA and Indian-labour-law-compliant out of the box.

Approvals Inbox — One Queue for Every Decision

Projects, DPRs, VOs, contractor bills, labour bills, ITPs — every decision waiting for you, in **one inbox**. Approve or reject in one click; the underlying action happens in the same transaction. The end of WhatsApp escalations.

Reports — Insight You Can Send

Exportable analytics for every audience: BOQ vs Actual, bill aging, GST and TDS summaries, attendance and payroll, project health, NCR registers, incident logs. CSV and PDF, ready for the client, the board, or the auditor.

Administration — Total Control of Access

Admin

Users, built-in roles, **custom roles you design yourself**, organisations, project quotas, per-organisation and per-project module access. Everything you need to scale from a single site to a multi-region operation — and the only place a sensitive setting can change.

Custom Roles — Permissions That Fit Your Team

The 11 built-in roles aren't enough? **Build your own.** Pick capabilities from a checklist grouped by domain — Projects, Approvals, DPRs, Finance, Workforce, Supply Chain, Admin. Custom roles **add** to a user's built-in role — they never strip it. Your governance, your way.

What Makes Mystics Civil Different

Special feature	Why it matters
Custom roles, additive on top of built-ins	Governance fits your org chart, not the other way around.
Automatic nightly rate refresh (DSR, state, in-house)	Bid and estimate on today's prices — not last quarter's.
Geofenced attendance	Eliminate ghost workers; lock muster to the actual site.
Unified Approvals Inbox	One queue, every decision — projects, DPRs, VOs, bills, ITPs.
Auto-deductions on bills	TDS, retention, LWF, advance recovery — applied without human error.
DPR → WBS in one transaction	Earned value is live, not month-end.
Module access per org <i>and</i> per project	A small repair project hides the modules it doesn't need.
Permanent audit trail on every record	Every approval, every transition, forever.
Indian construction defaults	BOCW, EPF, ESI, GST, TDS 194C, retention — out of the box.
Multi-tenant from day one	Run multiple organisations from a single deployment.

A Project, End-to-End, in One Place

Day 0 — Admin sets up the org, creates users, defines a "Junior PM" custom role. **Week 1** — PM creates Tower B, Sector 7; owner approves from the inbox. **Week 2** — QS builds the L5 BOQ from the live DSR library; storekeeper raises indents; RFQs go to vendors. **Every day** — Site engineer marks attendance (geofence verified), files the DPR; PM approves it next morning; WBS updates instantly. **A failed cube test** — auto-opens an NCR; contractor submits CAPA; closed in 48 hours. **A scope change** — QS drafts a VO; owner approves; flows into billing automatically. **Running bill** — TDS, retention, advance all auto-applied; finance pays via NEFT; ledger posts itself. **Week 12** — HR runs payroll: compute → approve → release. Done. **Day H** — All approvals resolved, NCRs closed, retentions released on schedule. PM marks the project **Completed**. The record becomes a permanent, auditable history.

Ready to See It Live?

Mystics Civil — built to make construction operations **clear, controlled, and accountable.**

Demo credentials are ready. Pick a role and walk through your own project, end to end.
