

Mystics Civil

Construction Operations Platform — Complete Guide & Demo Handbook

Welcome

Mystics Civil is an all-in-one platform for running construction projects. It brings the site, the back office, and the leadership team onto the same page — from the moment a project is conceived, through daily execution, to the day it is handed over to the client.

This guide walks you through everything Mystics Civil does, in plain language. No technical knowledge is required. You can read it cover to cover, or jump straight to the section that matches your role.

What Mystics Civil Helps You Do

- **Plan** projects, budgets, and schedules with confidence.
- **Run** site work — track daily progress, attendance, materials, and quality.
- **Control** money — bills, payments, deductions, and client invoices.
- **Decide** with live dashboards and reports.
- **Govern** with role-based access, approvals, and complete audit trails.

Mystics Civil keeps every stakeholder — site engineer, project manager, quantity surveyor, finance officer, owner — working from a single source of truth.

Who Uses Mystics Civil

The platform organises people by role. Each role sees the screens and information that matter to them, and nothing else.

Role	Typical responsibilities
Owner / Director	Approves new projects and major changes, reviews dashboards, monitors profitability.
Administrator	Manages users, sets up roles, configures the organisation.
Project Manager	Drives execution: plans schedule, approves daily reports, manages variations.
Site Engineer	Files daily reports, marks attendance, uploads photos, raises issues.
Quantity Surveyor	Builds estimates, verifies quantities, prepares variation orders.
Finance Officer	Processes bills, applies deductions (TDS, retention, advances), pays vendors, raises client invoices.
Quality Controller	Approves inspection plans, records test results, raises non-conformance reports.
Storekeeper	Receives materials, manages stock, issues to site.
HR Officer	Maintains worker records, runs payroll.
Contractor	Submits daily progress and bills for their scope of work.
Viewer	Read-only access for auditors, consultants, or visiting stakeholders.

In addition to these built-in roles, an administrator can create **custom roles** — for example, "Junior Project Manager" — by picking exactly the permissions that role should have.

The Building Blocks

Three simple ideas underpin everything in Mystics Civil:

1. **Organisation** — Your company. All your projects, people and data sit inside it. Larger groups can run multiple organisations side by side.
 2. **Project** — A construction project belonging to your organisation.
 3. **Modules** — The feature areas (Projects, Daily Reports, Finance, Supply Chain, Workforce, Quality, Safety, Estimation, Reports). Each one can be switched on or off per organisation or per project, so you only see what you need.
-

The Modules

1. Projects — The Heart of the Platform

Every piece of work in Mystics Civil ties back to a project.

Creating a project

A project manager fills in a short form: name, client, location, start date, expected completion, and budget. The platform automatically:

- Reserves the project against the organisation's project quota.
- Grants the creator access to the project.
- If the creator is not a senior leader, it routes the new project to the **Approvals Inbox** so an owner or administrator can review and approve it.

A project's life

Every project moves through a clear set of stages:

Pending approval → Not started → On track → (At risk / Delayed / On hold as needed) → Completed

The project manager updates the health (on track, at risk, delayed, on hold) as conditions change. Every change is logged for transparency.

Inside a project

Each project page is a tabbed dashboard with everything you need:

- **Plan** — Work Breakdown Structure (WBS) and Milestones.
- **Execution** — Daily Progress Reports, photos, documents, issues.
- **Money** — Bills, vouchers, ledger, client invoices.
- **People & Materials** — Workforce, supply chain, stores.
- **Quality & Safety** — Inspection plans, tests, NCRs, permits, incidents.

- **Settings** — Team access, enabled modules.
-

2. Work Breakdown Structure & Milestones

Work Breakdown Structure (WBS)

A project is broken into a tree of activities — for example, *Substructure* → *Excavation* → *Earthwork in foundations*. Each activity carries a planned quantity (cubic metres, tonnes, square metres, etc.) and a cost weight. As work is reported on site, the platform automatically rolls progress up the tree.

Milestones

Milestones are the dates that matter — *Foundation complete*, *Slab cast*, *Handover*. Each milestone shows its health (on track, at risk, delayed, completed) so leadership instantly sees what needs attention.

3. Daily Progress Reports (DPRs)

The daily heartbeat of the project.

How it works

1. The site engineer (or contractor) creates the day's report — manpower deployed, weather, work executed against each activity, and remarks.
2. They attach site photos and any relevant documents.
3. They **submit** the report. It lands in the project manager's Approvals Inbox.
4. The project manager reviews and **approves** (or rejects with a reason). Approved quantities automatically update the WBS — so "earned value" is always live.

This single workflow gives you an accurate, auditable daily picture of the project without anyone shuffling spreadsheets.

4. Photos, Documents & Issues

- **Photos** — Geotagged site photos, organised by date and activity. Perfect for client updates and disputes.
- **Documents** — Drawings, contracts, certificates, vendor papers — all versioned, so you always know which revision is current.
- **Issues** — A simple snag list. Anyone on site can raise an issue (low / medium / high / critical). It stays open until resolved, with a clear record of who fixed it and when.

5. Estimation, Bill of Quantities & Rate Engine

A five-level estimating ladder takes you from a rough order-of-magnitude number to a fully detailed contract BOQ:

Level	What it is	When you use it
L0	Square-foot rate	Earliest feasibility
L1	Parametric, by cost head	Concept stage
L2	Schematic BOQ	Design development
L3	Detailed BOQ with rate build-up	Pre-tender
L4	Tender BOQ	Bidding
L5	Contract / awarded BOQ	After award

Rate engine

Mystics Civil holds a live library of unit rates — Delhi Schedule of Rates (DSR), state schedules, in-house catalogues, and vendor quotes.

- Rates refresh **automatically every night at 2 AM**, so your estimates use today's prices, not last quarter's.
- You can also trigger a manual sync any time from the *DSR Rates* screen.

6. Variation Orders

Scope changes are inevitable. Mystics Civil makes them controllable.

A quantity surveyor or project manager drafts a Variation Order describing what changed, by how much, and why. The VO is submitted into the Approvals Inbox; once approved by an authorised person, it flows through into:

- The BOQ-versus-Actual report
- Contractor billing
- Client invoicing

Workflow: Draft → Submitted → Approved (or Rejected)

Once approved or rejected, the VO is locked, giving a clean paper trail for the client and auditors.

7. Finance Module

Everything about money — in plain terms.

Contractor bills

When a contractor raises a bill, the platform takes it through:

1. **Draft** by the contractor or your QS.
2. **Verification** — the QS confirms quantities; the project manager certifies the work.
3. **Approval** — finance approves the final amount.
4. **Auto-deductions** — Mystics Civil automatically applies:
 - **TDS** (income-tax deduction at source)
 - **Retention** (typically 5%, held until completion)
 - **Labour Welfare Fund** where applicable
 - **Advance recovery** if mobilisation or material advances are outstanding
5. **GST** is registered against the bill.

6. **Payment** — the bill is paid via a payment voucher (cash, cheque, NEFT or RTGS).
7. **Ledger posting** — the company's ledger is updated automatically. No manual journal entries.

Client invoicing

The mirror image: invoices issued to your client move from *Draft* to *Sent* to *Paid*, with all GST, retention release and TDS positions tracked.

Ledger, GST, TDS, Retention, Advances

Each of these has its own clean register so your finance team — and your auditor — can pull a complete view any time.

8. Supply Chain Module

From the moment the site asks for material to the moment it lands in the store and is consumed.

Indent → RFQ to vendors → Vendor responses → Award → Purchase Order → Goods Receipt (with quality check) → Stock

Vendor master

A central list of approved vendors, with statuses (active, blacklisted, KYC pending) and complete history of orders placed.

Material indents & RFQs

The site raises an **indent** for what it needs. Above a threshold, the indent must be approved before a **Request for Quotation** is sent to multiple vendors. The platform collects vendor responses so awards are transparent and comparable.

Purchase Orders & Goods Receipts

The awarded PO is issued to the vendor. When the material arrives, a **Goods Receipt Note** (GRN) is created — with quality samples recorded against it. Failed tests automatically raise a quality non-conformance (see Quality module).

Stock, issues & wastage

Every stock movement — receipt, issue to site, transfer, wastage — is recorded in a permanent stock ledger. You always know what is in the store and what has been consumed.

Rate contracts

Pre-negotiated rates with key vendors so repeat purchases happen faster and cheaper.

9. Workforce Module

Worker master

Every worker on site is registered with the basics — name, trade, skill level, daily and overtime rate, contact details, bank details, and BOCW (statutory) registration.

Attendance

- **Bulk muster** — the supervisor marks the whole roster in one go each day (present, absent, half-day, overtime hours).
- **Geofence check** — attendance can be validated against the project's coordinates (a 200-metre radius). No more remote mark-ups.

Payroll

Payroll runs as a **period** — typically weekly.

Open period → Compute → Approve → Pay

The platform aggregates attendance and overtime, applies the configured rates, and deducts statutory items (EPF, ESI, PT) where applicable. Once approved, the period is locked and wage slips are ready to release.

Labour contractor bills

For workers supplied by labour contractors, bills follow the same clear path — **Draft** → **Submitted** → **Approved (or Rejected)** — and flow into the finance ledger like any other contractor bill.

10. Quality Module

Inspection & Test Plans (ITPs)

Before an activity begins, an ITP lists every checkpoint and test that must be passed. ITPs are approved by the Quality Controller, so nothing slips through.

Inspection requests

The site raises an inspection request when an activity is ready. The Quality Controller carries out the check and records the result.

Non-Conformance Reports (NCRs)

If a check fails, an NCR is opened. The contractor submits a corrective and preventive action (CAPA). The NCR moves **Open** → **CAPA submitted** → **Closed**, with every step time-stamped.

Quality tests

IS-code tests (cube strength, slump, sieve analysis, etc.) are recorded against the activity for full traceability.

11. Safety Module

A complete safety register out of the box:

- **Hazard Identification & Risk Assessment** (HIRA) for the project.
 - **Job Safety Analysis** (JSA) for each activity.
 - **Permits** — hot work, work at height, confined space, electrical — with statuses (pending → approved → expired).
 - **PPE issues** — every helmet, vest, glove and harness issued to a worker is recorded.
 - **Incidents** — near-misses, first-aid cases, lost-time injuries, and (we hope never) fatalities are logged with classification, root cause and CAPA.
-

12. Approvals Inbox

One unified inbox shows every decision waiting for you, across the whole platform:

- New projects awaiting approval
- Daily Progress Reports submitted by the site
- Variation Orders
- Contractor bills
- Labour contractor bills
- Inspection & Test Plans

You see who raised it, when, against which project, with a one-click link to the full record. Approving or rejecting from the inbox performs the underlying action automatically — no extra screens, no forgotten transitions.

13. Dashboards & Reports

Dashboard

Open the dashboard and see in seconds:

- Active projects versus total
- Pending approvals across all domains
- Daily Progress Reports filed today and this week
- Budget versus actual spend, live
- Schedule variance, live

Reports

Exportable reports for every audience:

- **BOQ versus Actual** — variance by cost head, drillable to activity.
- **Financial** — bill aging, payment status, GST and TDS summaries.
- **Workforce** — attendance summaries and payroll runs.
- **Project health** — milestones at risk, open NCRs, safety incidents.

Every report can be exported to CSV or PDF for sharing with the client, auditor, or board.

14. Administration

The **Admin** screen is the control room for your organisation.

Users

Create, edit or remove users. For each user you set:

- Built-in role (Project Manager, Finance, Site Engineer, etc.)
- Organisation
- Optional **custom role** (e.g. "Junior PM")
- Per-project access

You can also reset a user's password from here.

Custom roles

If the built-in roles don't fit, create your own — for example, "Site Auditor" with read access plus the ability to raise NCRs. Pick the exact capabilities the role should have from a checklist grouped by area (Projects, Approvals, Daily Reports, Finance, Workforce, Supply Chain, Admin).

Custom roles are **additive** — they never remove capabilities from the built-in role, only add to them.

Organisations (super-admin only)

Set the maximum number of projects an organisation may run, edit organisation details (legal name, GSTIN, PAN, address), and enable or disable modules at the organisation level.

Module access

Switch entire feature areas on or off for an organisation, or override the setting per project — so a small repair job can hide the full Supply Chain module if it isn't needed.

15. Files, Photos & Documents

Mystics Civil includes secure storage for every document, photo and attachment generated on the project. Files are uploaded directly from the browser through short-lived secure links, so nothing sensitive travels through unprotected channels. Permissions follow your role and project access — you can only download what you're entitled to see.

16. Audit Trail & Governance

Behind every screen, Mystics Civil keeps a complete history:

- Who created or changed each record, and when.
- Every approval, rejection and resubmission.
- Every status change on a project, DPR, VO, bill, NCR or incident.

This gives your finance team, your auditor, and your client total confidence that the numbers and the dates can be trusted.

A Demo: A Project From Start to Finish

Let's walk through a realistic project the way you would using Mystics Civil.

Day 0 — Set-up

The **Administrator** creates the organisation, sets the project quota, and adds users for the team — a project manager, two site engineers, a quantity surveyor, a finance officer, a quality controller, a storekeeper and an HR officer. A "Junior PM" custom role is created so a trainee can view everything and file DPRs but not approve them.

Week 1 — Initiation

The **Project Manager** creates a new project — *Tower B, Sector 7*. Because the PM is not a senior leader, the project lands in the **Owner's** Approvals Inbox. The owner reviews the budget and approves; the project moves to **Not started**.

The PM defines the WBS (Excavation, PCC, Foundation, Columns, Slabs, Finishes) and adds key milestones (Foundation complete, Slab-1 cast, Topping out, Handover).

The **Quantity Surveyor** builds the BOQ to **L5** using the live DSR rate library.

Week 2 — Procurement & mobilisation

The **Storekeeper** raises material indents for cement and steel. The QS sends RFQs to three vendors, compares quotes, and awards POs. The HR Officer onboards 30 workers with bank details and BOCW registration.

Daily — Execution

Each evening the **Site Engineer** marks attendance (geofence verified), files the **Daily Progress Report** with quantities executed and site photos, and submits it. The **Project Manager** reviews the inbox first thing the next morning and approves — the WBS updates instantly with earned value.

Materials arrive at the gate; the storekeeper creates GRNs with quality samples. A failed cube test raises an **NCR**, which the contractor closes within two days with a

CAPA.

The PM moves the project from **On track** to **At risk** when monsoon rains hit, then back to **On track** the following week.

Mid-project — Variations & bills

The client requests a façade change. The QS drafts a **Variation Order** with revised quantities and rate. The owner approves it. The change flows automatically into the contractor's running account.

The contractor submits a running bill. The QS verifies quantities, the PM certifies, and finance approves. **TDS, retention and an outstanding advance** are deducted automatically. A payment voucher goes out via NEFT, and the ledger updates itself.

End of period — Payroll & invoicing

The **HR Officer** closes the weekly payroll period; the platform computes wages and deductions; finance approves and releases payment.

Finance raises a **client invoice** for the milestone — GST applied, retention deducted — and tracks it from *Sent* to *Paid*.

Closeout — Handover

All approvals resolved, all NCRs closed, retentions released on schedule. The PM marks the project **Completed**. The record becomes read-only — a permanent, auditable history of how the project ran.

Why Mystics Civil

- **One source of truth.** Site, office and leadership all working from the same data, live.
 - **Approvals that flow.** A unified inbox replaces email chains, WhatsApp messages and printed forms.
 - **Money under control.** Bills, deductions, payments, invoices, GST, TDS, retention and advances — all linked, all auto-posted to the ledger.
 - **Quality and safety on the record.** ITPs, NCRs, permits and incidents are tracked formally, not informally.
 - **Live earned value.** Daily reports automatically update the WBS, so progress is always real.
 - **Permissions you can shape.** Built-in roles plus custom roles give every person exactly what they need, no more, no less.
 - **Audit-ready.** Every change, every approval, every transition is logged forever.
-

Quick Reference — Module at a Glance

Module	What it gives you
Projects	Create, plan, track and close projects through a clear lifecycle.
WBS & Milestones	Hierarchical activities and key dates with health flags.
Daily Progress Reports	The daily heartbeat — quantities, photos, approvals, earned value.
Photos, Documents, Issues	Site documentation and snag list in one place.
Estimation	Five-level estimating with a live rate library.
Variation Orders	Controlled scope changes with full approval trail.
Finance	Bills, deductions, payments, invoices, GST, TDS, retention, ledger.
Supply Chain	Indents, RFQs, POs, GRNs, stock and rate contracts.
Workforce	Worker master, geo-verified attendance, payroll, contractor bills.
Quality	ITPs, inspections, IS-code tests, NCRs with CAPA tracking.
Safety	HIRA, JSA, permits, PPE issues, incidents.
Approvals Inbox	One queue for every decision waiting on you.
Dashboards & Reports	Live KPIs and exportable analytics.
Administration	Users, roles, organisations, module access.

Mystics Civil — built to make construction operations clear, controlled, and accountable.
